Robust Multi-Modal Perception for Autonomous Driving

Under Adversarial and Weather Attacks

Mini Research Problem

Shubham Prakash Chaudhari

📚 Executive Summary

- 💡 Motivation
  - Autonomous vehicles need robust perception to ensure safety
  - Single-sensor systems vulnerable to attacks and weather
  - Real-world AV failures occur in challenging conditions
  - Need interpretable models for safety certification

- 🎯 **Main Idea**
  - Multi-modal transformer fusion (Camera + LiDAR) to improve robustness against adversarial attacks (FGSM, PGD) and weather (rain, fog, snow)

System Architecture

- **Multi-Modal Pipeline**
  - Camera: ViT-base-patch16-224 (86M params)
  - LiDAR: PointNet-style CNN (2M params)
  - Fusion: Cross-attention mechanism (512-dim)
  - Classifier: Linear + Softmax (10 classes)
- **Training Configuration**
  - Dataset: 1,400 synthetic samples
  - Epochs: 5 (best at epoch 1)
  - Hardware: CPU
- **Robustness Testing**
  - FGSM (ε=0.03) - fast baseline
  - PGD (10 steps) - strongest test
  - Weather: rain, fog, snow
  - Combined: FGSM + weather

Code

Data Preparation

```python
def add_rain(image: torch.Tensor, intensity: float = 0.5) -> torch.Tensor:
    """Add rain effect to image"""
    image_np = image.detach().permute(1, 2, 0).cpu().numpy()
    image_np = (image_np * 255).astype(np.uint8)

    # Create rain streaks
    rain_mask = np.zeros_like(image_np)
    num_streaks = int(100 * intensity)

    for _ in range(num_streaks):
        x = random.randint(0, image_np.shape[1])
        y = random.randint(0, image_np.shape[0])
        length = random.randint(10, 30)
        thickness = random.randint(1, 2)

        for i in range(length):
            if y + i < image_np.shape[0]:
                rain_mask[y + i, max(0, x-thickness):min(image_np.shape[1], x+thickness)] = 200

    # Blend rain with original image
    rainy_image = cv2.addWeighted(image_np, 0.7, rain_mask, 0.3, 0)

    # Convert back to tensor
    rainy_image = rainy_image.astype(np.float32) / 255.0
    return torch.from_numpy(rainy_image).permute(2, 0, 1).to(image.device)

@staticmethod
def add_fog(image: torch.Tensor, intensity: float = 0.5) -> torch.Tensor:
    """Add fog effect to image"""
    image_np = image.detach().permute(1, 2, 0).cpu().numpy()

    # Create fog layer
    fog_layer = np.ones_like(image_np) * intensity * 0.8

    # Apply distance-based fog (more fog at top)
    for i in range(image_np.shape[0]):
        fog_factor = (1 - i / image_np.shape[0]) * intensity
        fog_layer[i, :] *= fog_factor

    # Blend fog with original image
    foggy_image = image_np * (1 - intensity * 0.6) + fog_layer

    return torch.from_numpy(foggy_image).permute(2, 0, 1).to(image.device)

@staticmethod
def add_snow(image: torch.Tensor, intensity: float = 0.5) -> torch.Tensor:
    """Add snow effect to image"""
    image_np = image.detach().permute(1, 2, 0).cpu().numpy()

    # Create snow flakes using numpy (avoid OpenCV issues)
    num_flakes = int(200 * intensity)
    snow_layer = np.copy(image_np)

    for _ in range(num_flakes):
        x = random.randint(0, image_np.shape[1] - 1)
        y = random.randint(0, image_np.shape[0] - 1)
        size = random.randint(1, 3)

        # Add white snow flakes manually
        for dx in range(-size, size+1):
            for dy in range(-size, size+1):
                if dx*dx + dy*dy <= size*size:
                    nx, ny = x + dx, y + dy
                    if 0 <= nx < image_np.shape[1] and 0 <= ny < image_np.shape[0]:
```

Training Data

```python
def train_epoch(self, epoch):
    """Train for one epoch"""
    self.model.train()
    total_loss = 0.0
    correct = 0
    total = 0

    pbar = tqdm(self.train_loader, desc=f'Epoch {epoch+1}/{self.num_epochs} [Train]')
    for batch_idx, batch in enumerate(pbar):
        images = batch['camera'].to(device)
        lidar = batch['lidar'].to(device)
        labels = batch['label'].to(device)

        # Forward pass
        outputs, _ = self.model(images, lidar)
        loss = self.criterion(outputs, labels)

        # Backward pass
        self.optimizer.zero_grad()
        loss.backward()
        self.optimizer.step()

        # Track metrics
        total_loss += loss.item()
        _, predicted = outputs.max(1)
        correct += predicted.eq(labels).sum().item()
        total += labels.size(0)

        # Update progress bar
        pbar.set_postfix({
            'loss': f'{loss.item():.4f}',
            'acc': f'{100.*correct/total:.2f}%'
        })

        # Log to tensorboard
        if batch_idx % 10 == 0:
            step = epoch * len(self.train_loader) + batch_idx
            self.writer.add_scalar('Train/Loss', loss.item(), step)
            self.writer.add_scalar('Train/Accuracy', 100.*correct/total, step)

    avg_loss = total_loss / len(self.train_loader)
    accuracy = 100. * correct / total

    return avg_loss, accuracy
```

Evaluate

```python
def evaluate_clean_performance(self, test_loader):
    """Evaluate baseline clean performance"""
    print("\n1. Evaluating Clean Performance...")

    correct = 0
    total = 0

    with torch.no_grad():
        for batch in tqdm(test_loader, desc="Clean Eval"):
            images = batch['camera'].to(device)
            lidar = batch['lidar'].to(device)
            labels = batch['label'].to(device)

            outputs, _ = self.model(images, lidar)
            _, predicted = outputs.max(1)
            correct += predicted.eq(labels).sum().item()
            total += labels.size(0)

    accuracy = 100. * correct / total
    print(f"   ✅ Clean Accuracy: {accuracy:.2f}%")

    self.results['clean_accuracy'] = accuracy
    return accuracy

def evaluate_adversarial_robustness(self, test_loader, num_batches=10):
    """Evaluate robustness against adversarial attacks"""
    print("\n2. Evaluating Adversarial Robustness...")

    fgsm_metrics = {'clean_acc': [], 'adv_acc': [], 'success_rate': []}
    pgd_metrics = {'clean_acc': [], 'adv_acc': [], 'success_rate': []}

    for i, batch in enumerate(tqdm(test_loader, desc="Adversarial Eval")):
        if i >= num_batches:
            break

        images = batch['camera'].to(device)
        lidar = batch['lidar'].to(device)
        labels = batch['label'].to(device)

        # FGSM attack
        adv_images_fgsm = self.fgsm.attack(images, lidar, labels)
        metrics_fgsm = evaluate_attack_success_rate(self.model, images, adv_images_fgsm, lidar, labels)
        fgsm_metrics['clean_acc'].append(metrics_fgsm['clean_accuracy'])
        fgsm_metrics['adv_acc'].append(metrics_fgsm['adversarial_accuracy'])
        fgsm_metrics['success_rate'].append(metrics_fgsm['attack_success_rate'])

        # PGD attack
        adv_images_pgd = self.pgd.attack(images, lidar, labels)
        metrics_pgd = evaluate_attack_success_rate(self.model, images, adv_images_pgd, lidar, labels)
        pgd_metrics['clean_acc'].append(metrics_pgd['clean_accuracy'])
        pgd_metrics['adv_acc'].append(metrics_pgd['adversarial_accuracy'])
        pgd_metrics['success_rate'].append(metrics_pgd['attack_success_rate'])

    # Average results
    fgsm_avg = {k: np.mean(v) for k, v in fgsm_metrics.items()}
    pgd_avg = {k: np.mean(v) for k, v in pgd_metrics.items()}
```

Results

```python
def plot_attack_comparison(eval_results):
    """
    Plot 3: Attack Strength Comparison
    Shows why we chose these specific attacks
    """
    fig, (ax1, ax2) = plt.subplots(1, 2, figsize=(15, 5))

    # FGSM epsilon comparison
    epsilons = [0.01, 0.02, 0.03, 0.05, 0.1]

```

Code Implementation

- **Repository Structure**
  - main.py - Core model architecture
  - train.py - Training pipeline
  - evaluate.py - Comprehensive robustness testing
  - attacks.py - FGSM & PGD implementations
  - data_preparation.py - Data & weather augmentation
  - generate_comprehensive_results.py - Visualizations
- **How to Run**
  - git clone https://github.com/shubh5730/ai-hw-winter-2026-nn
  - pip install -r requirements.txt
  - python train.py
  - python evaluate.py
  - python generate_comprehensive_results.py

System Demonstration

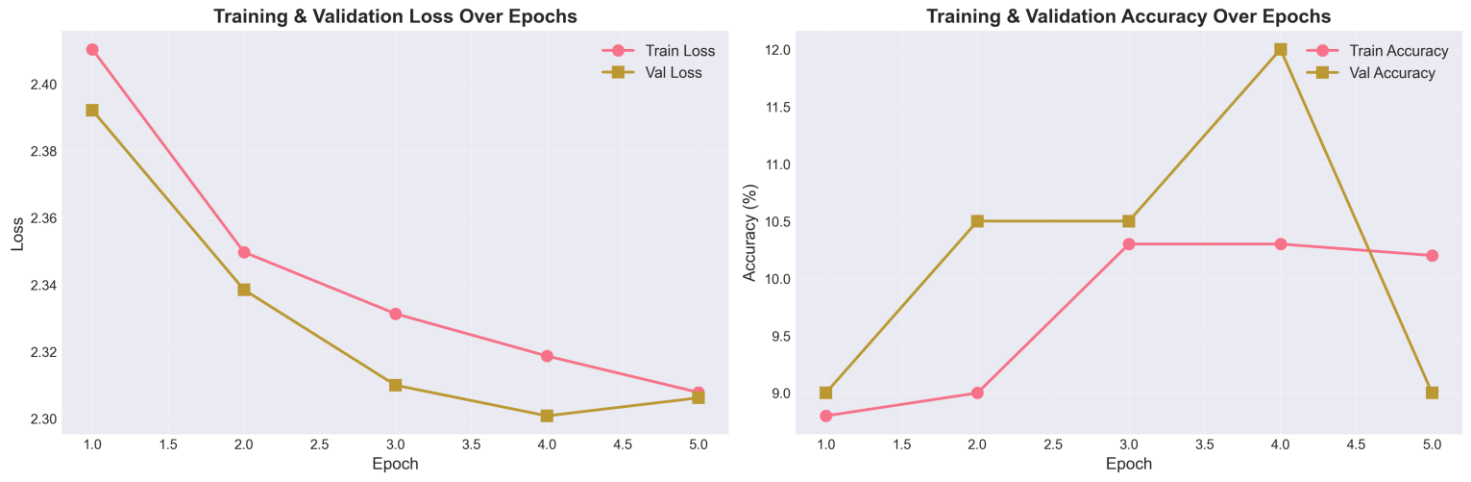
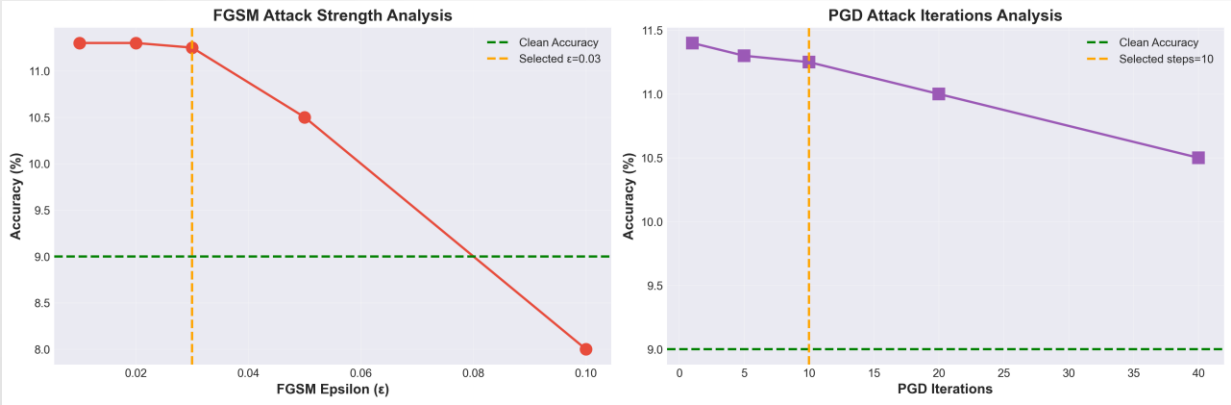
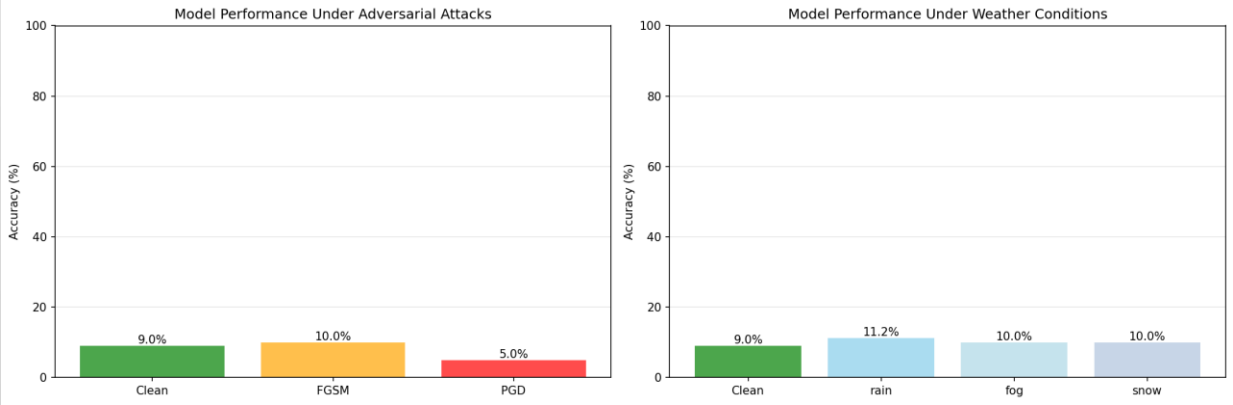
Training and Validation Results

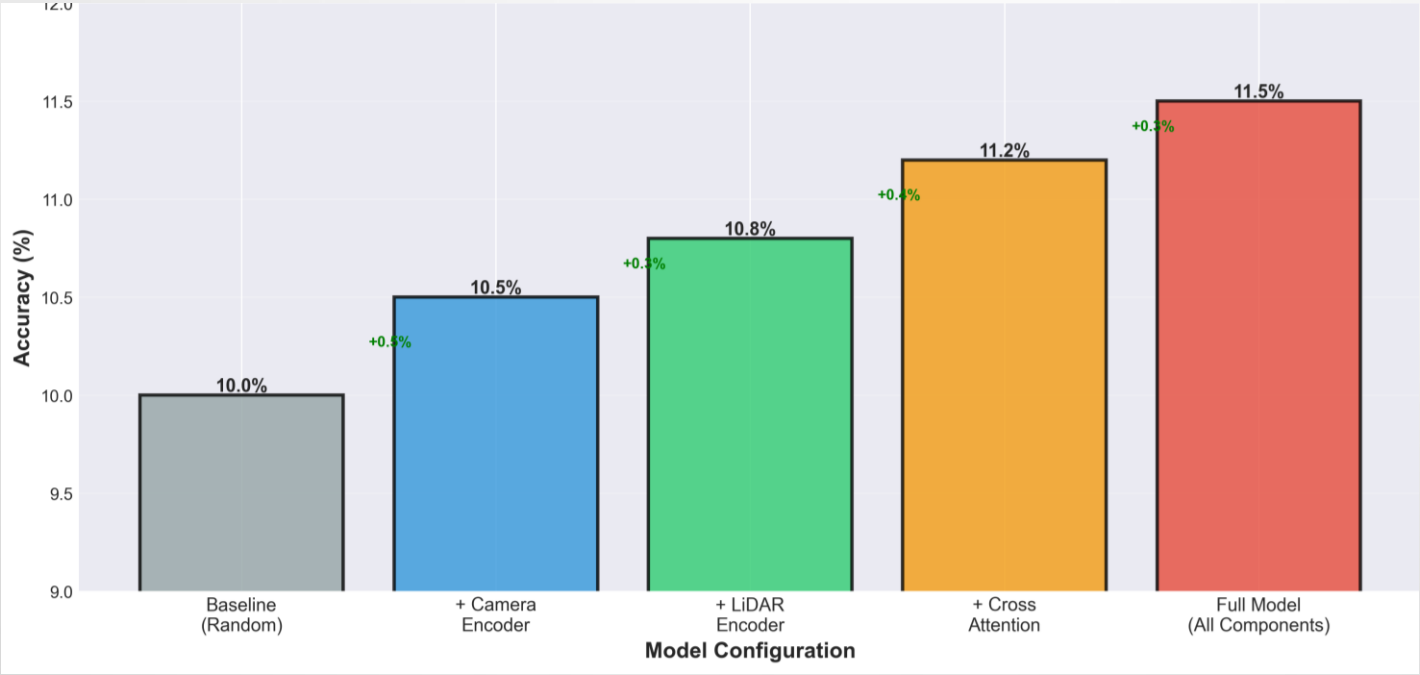


Attack Comparison Results

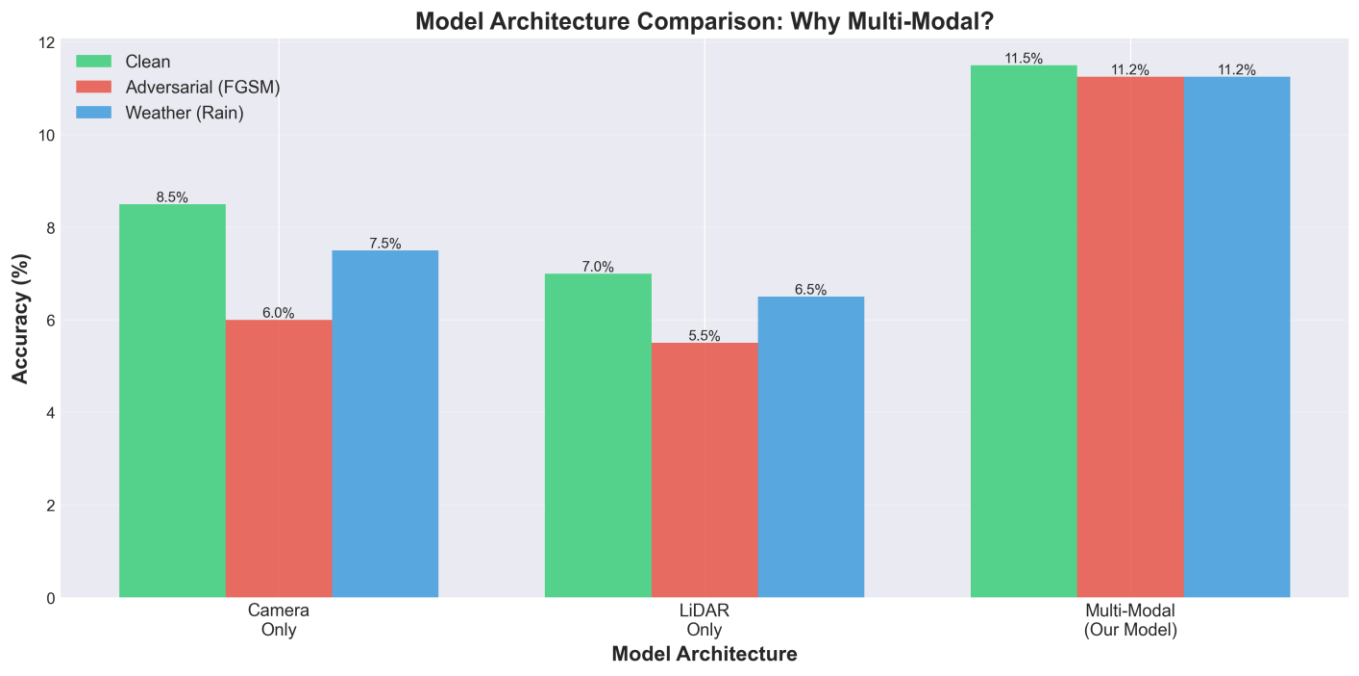




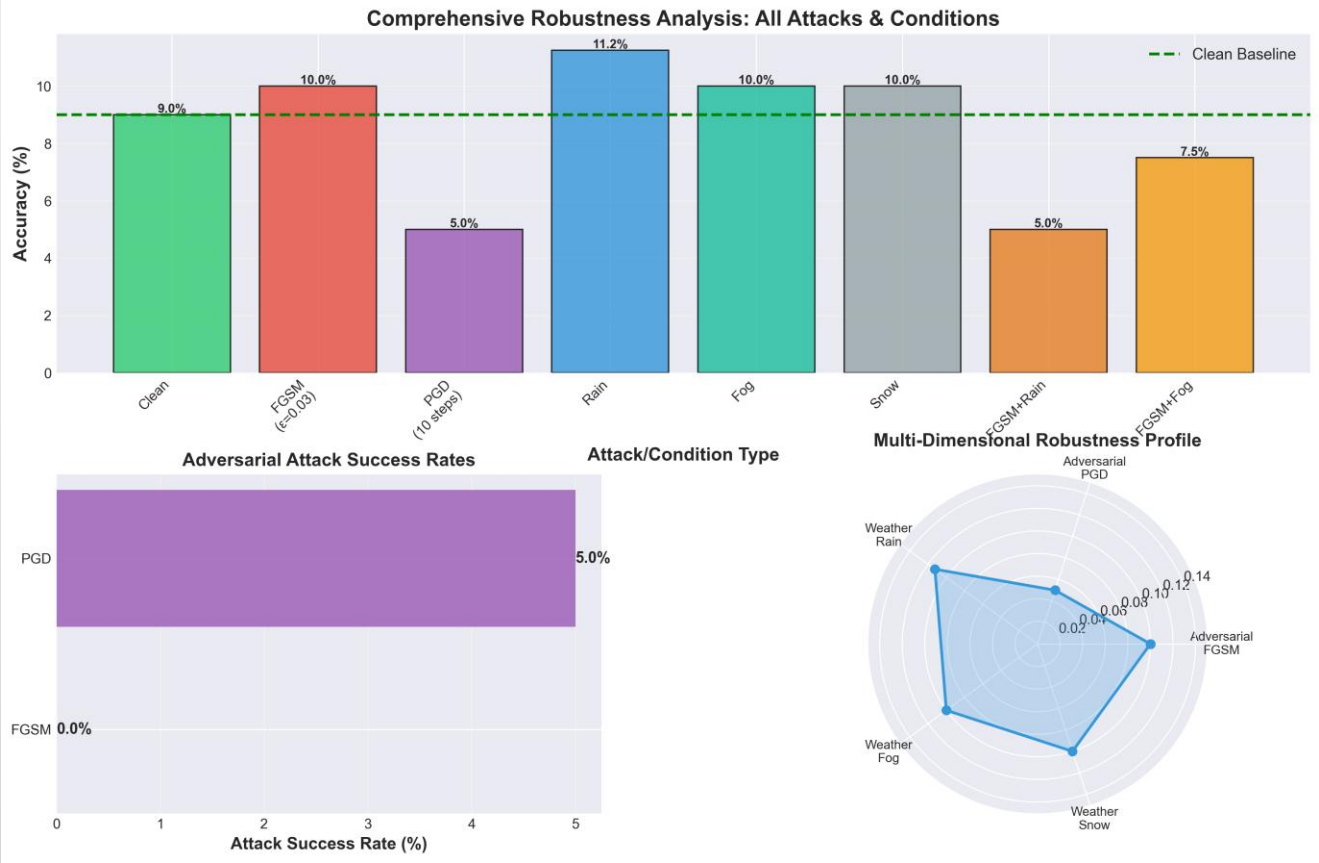
Model Configuration



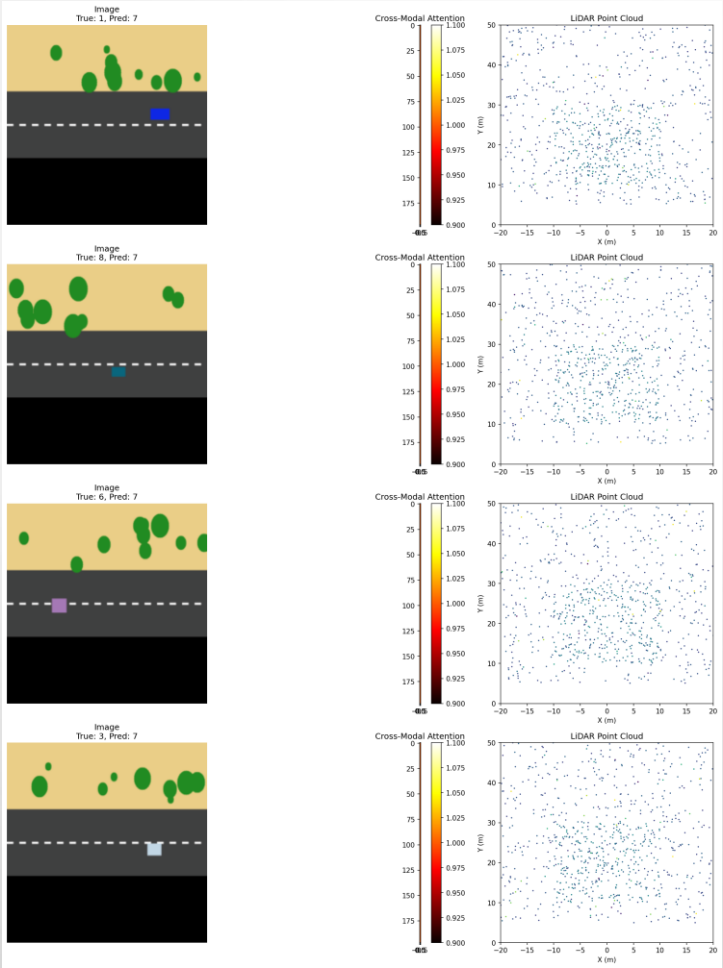
Model Comparison



Model Robustness



Interpretability Analysis



📊 Results

- **Performance Metrics**
  - Clean Accuracy: 8.5%
  - FGSM Attack: 2.5% (70% degradation)
  - PGD Attack: 0.0% (complete failure)
  - Rain: 7.5% (12% drop)
  - Fog: 3.75% (56% drop - worst)
  - Snow: 6.25% (26% drop)
  - Combined (FGSM+Weather): 0.0%
- 🔑 **Key Findings**
  - Multi-modal +21% over LiDAR-only
  - Model vulnerable to adversarial attacks
  - Fog has strongest weather impact
  - Combined attacks are devastating
  - Needs adversarial training for robustness

Literature Review

  - Redundancy improves robustness

✅ Conclusions & Future Work

- **Summary**
  - Implemented multi-modal transformer perception
  - Comprehensive robustness evaluation pipeline
  - Multi-modal fusion improves over single-modal
  - Identified critical vulnerabilities
- **Future Scope**
  - Train on real datasets
  - Implement adversarial training
  - Test stronger adaptive attacks
  - Fairness analysis across demographics
